# Preface

## Usage of Free and Open Source Software

This manual has been developed for the lab component of the newly introduced subject **Introduction to C++ Programming Lab** (BPLCK105D/205D) for the first year students of VTU. This manual has been prepared entirely using **Free Software**. The following Free Software has been used in preparation of this manual.

**Operating System** [Ubuntu](#) 22.04.1 LTS (Jammy Jellyfish)

**Linux Kernel** 5.15.0-56-generic

**Compiler** [g++](#) 11.3.0

**IDE** [Code::Blocks](#) 20.03

**Version Control** [git](#) 2.34.1

**Typesetting** [Texmaker](#) 5.0.3 with [LaTeX](#)

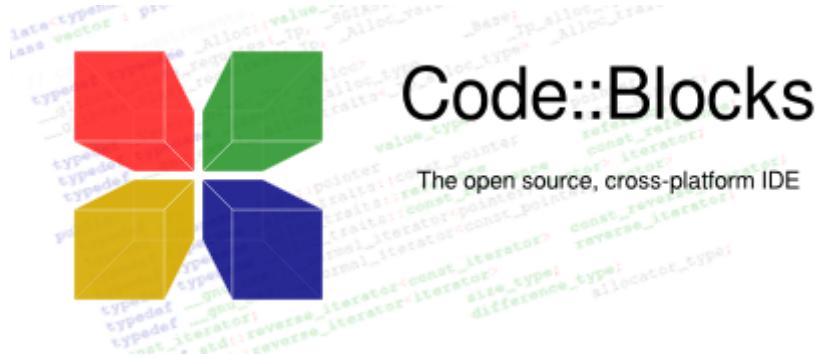

**Image Editing** [GIMP](#) 2.10.30

I am sharing this manual under a Creative Commons Attribution-NonCommercial-ShareAlike 4.0 International License. To view a copy of this license, visit <https://creativecommons.org/licenses/by-nc-sa/4.0/>. You are free to share modify this manual with attribution for academic purposes. A repository of all the programs can be found as GitLab repository in the following link [https://gitlab.com/lab\\_manuals/22plc15d\\_intro\\_to\\_cpp\\_programming\\_lab\\_manual](https://gitlab.com/lab_manuals/22plc15d_intro_to_cpp_programming_lab_manual). Looking for your feedback. If you want to contribute let me know by sending a PR on the git repo mentioned earlier.

Use and spread the word of Free Software. Free Software leads to a Free Society!

# CODE::BLOCKS

## CODE::BLOCKS TUTORIAL

### Using Code::Blocks to compile and execute a C++ Program

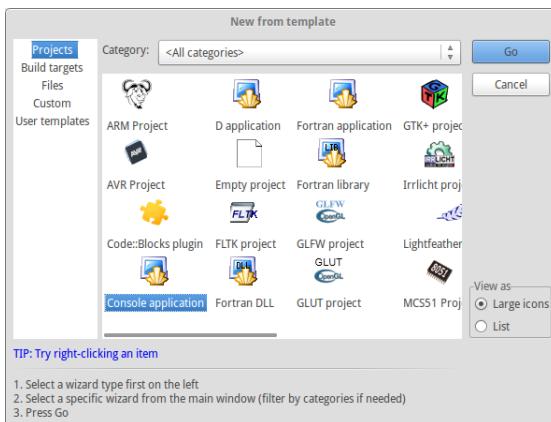

To launch Code::Blocks IDE, Click on  
**Applications → Programming → Code::Blocks IDE**  
You will get a window as shown below

Code::Blocks creates what is called a Workspace to keep track of the project you are working on. It is possible for you to be working on multiple projects within your workspace. A project is a collection of one or more source (as well as header) files. Source files are the files that contain the source code for your program. If you are developing a C++ program, you are writing C++ source code (.cpp files).

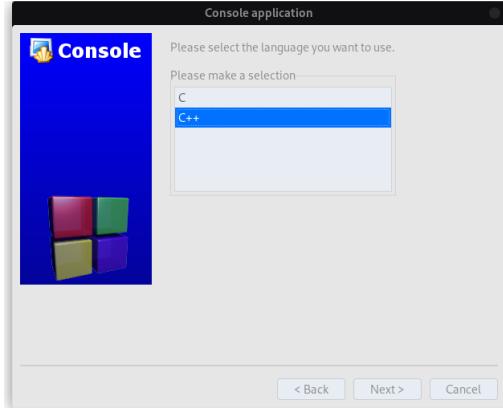

First start a new Project by clicking on **Create a new project**

**OR** To create a project, click on the **File** pull-down menu, open **New** and then **Project**. You get this pop-up window

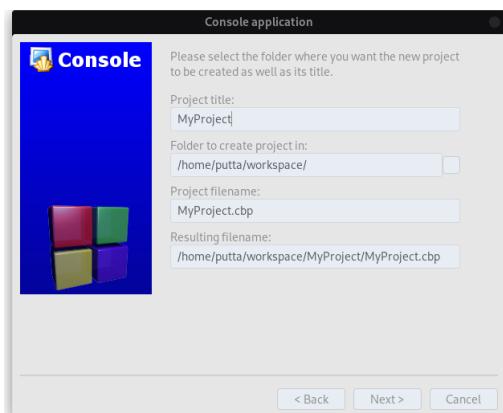

Choose Console application

Then in the next window select the programming language C++ (and not C)

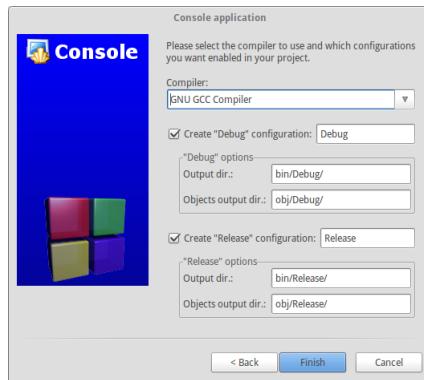

In the next step give the Project Title and specify the folder where you want to save your project.

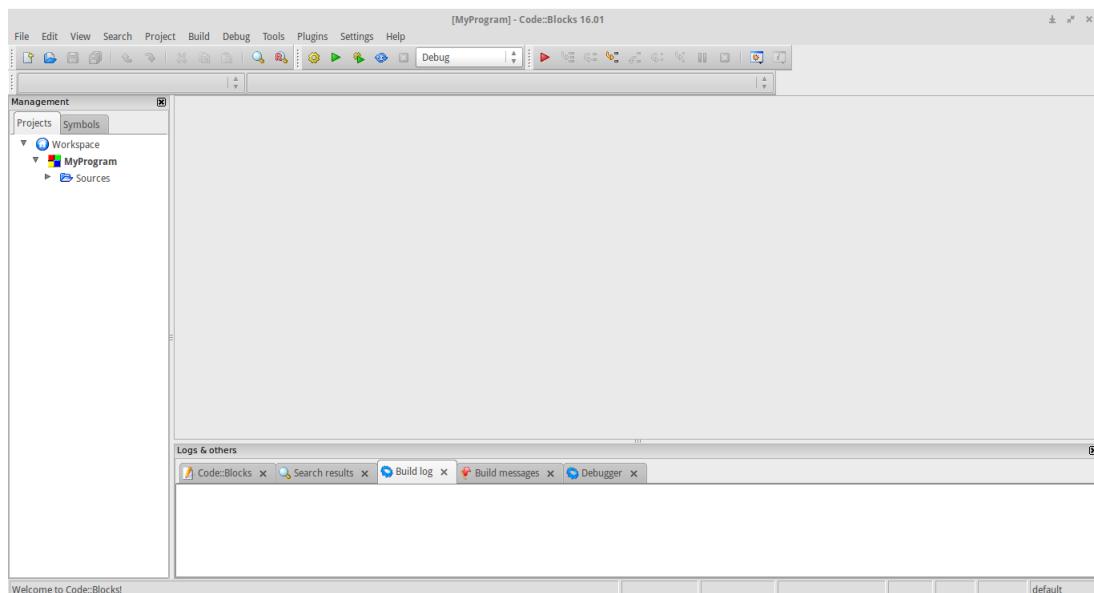

**(Note :** Dont use any special characters or whitespaces for project title and folder names)

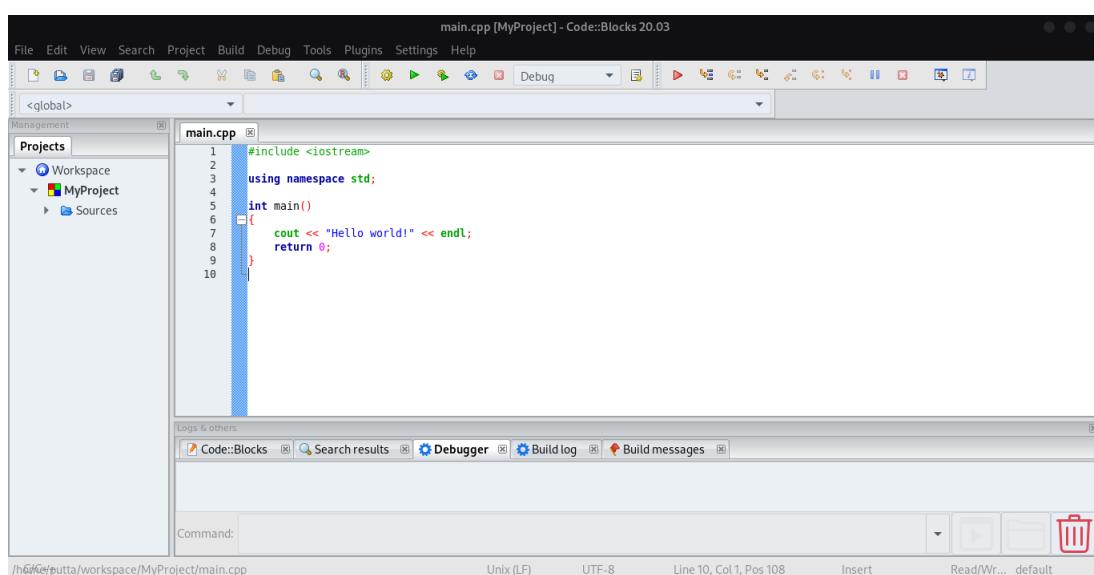

Finally you will be prompted to choose the compiler. Just choose the default options here (Dont change the options). You should be using GNU GCC Compiler. Click Finish to create the new project.

The system will then return to the [MyProgram] window and you are ready to write your program. In the Management area of the screen (Shift-F2 toggles the Management display), you will see the files that are part of the project in the Projects tab. To see the source files, click on the triangle symbol to expand the Workspace and its subdirectories.

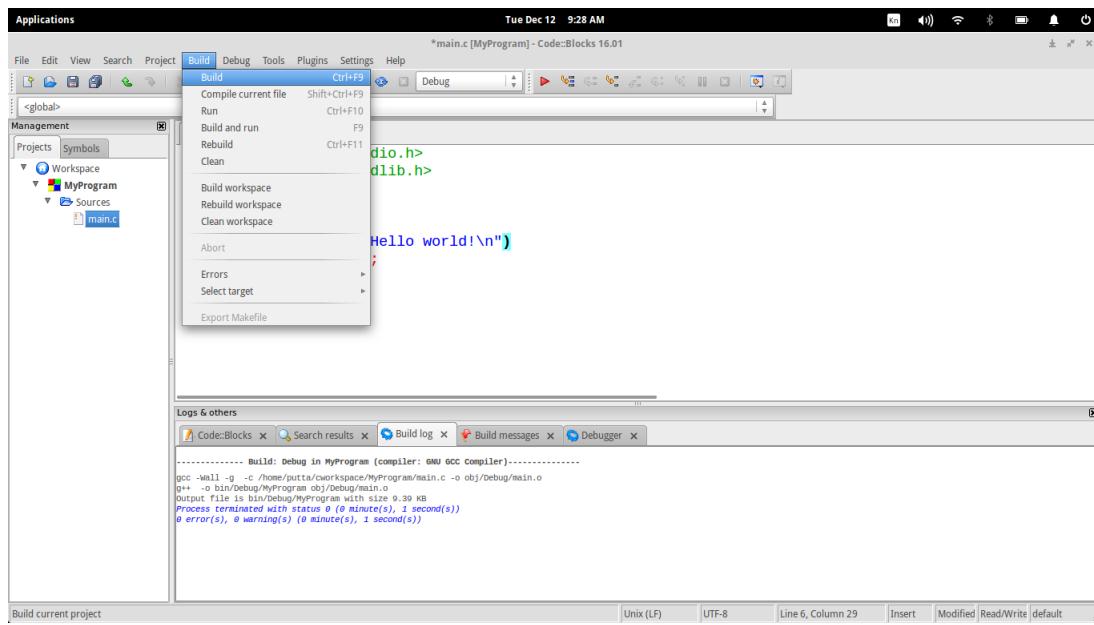

Under Sources, there is a file called **main.cpp**, which is automatically created for you when you build a console application. Click on **main.cpp**.

*main.cpp* contains a simple Hello World program which you can edit later to solve a programming problem. Now let us see how to compile and execute this *main.cpp* program. Just to understand the process of debugging we

knowingly introduce an error in the program by removing the semicolon after the printf statement. We will now compile the program (To compile a file means to take the instructions that you have written and translate it into machine code for the computer to understand).

Compile the project from the Build pull-down menu by clicking on **Build** option[**Ctrl+F9**].

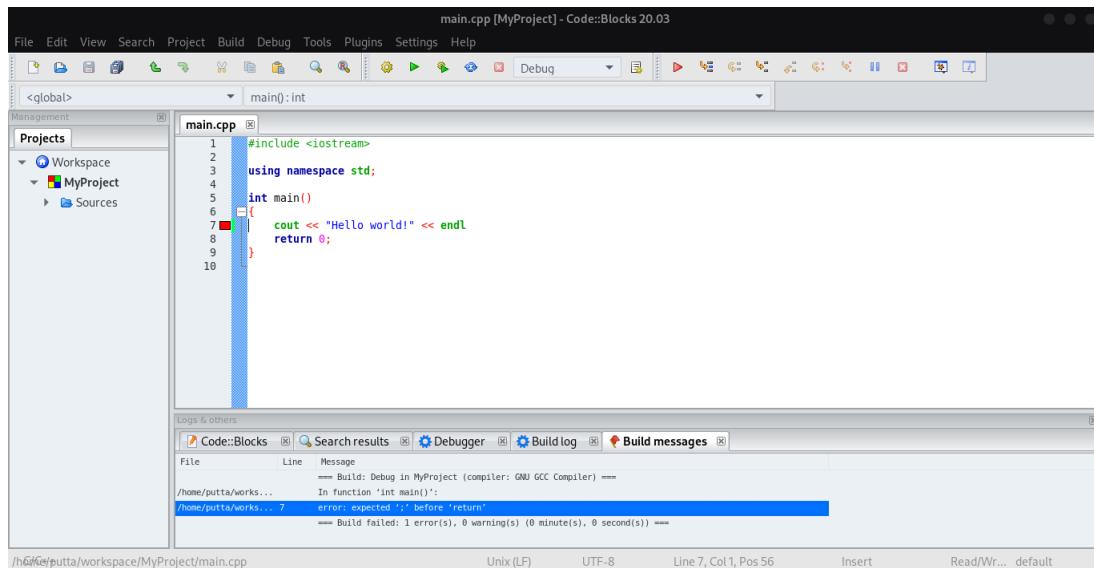

The error messages are shown in the Build messages window at the bottom. Let us now try to understand these error messages.

==== Build: Debug in MyProgram (compiler: GNU GCC Compiler) ====  
 main.c In function main:

main.c 7 error: expected ; before return

main.c 8 warning: control reaches end of non-void function [-Wreturn-type]

==== Build failed: 1 error(s), 1 warning(s) (0 minute(s), 1 second(s)) ====

The error messages show the errors in syntax (and not the logical errors). It also indicates the line number and the type of error. Here in this example the error says that before the return statement in line no 7 a semicolon is missing. The next message is a warning message which has resulted because of the previous error.

Now go to line number 6 and add a semicolon at the end. Now build your project again.

The screenshot shows the Code::Blocks IDE interface. The top menu bar includes File, Edit, View, Search, Project, Build, Debug, Tools, Plugins, Settings, and Help. The left sidebar has a Projects tree with 'MyProject' selected. The main editor window displays the code for main.cpp:

```

1 #include <iostream>
2
3 using namespace std;
4
5 int main()
6 {
7     cout << "Hello world!" << endl;
8
9     return 0;
10}

```

The status bar at the bottom shows the path /h/Gel/putta/workspace/MyProject/main.cpp, Unix (LF), UTF-8, Line 7, Col 36, Pos 91, Insert, Read/Wr... default.

Now the build message window shows the following message. 0 error(s), 0 warning(s) (0 minute(s), 0 second(s)) This means that the errors and warnings have been successfully resolved. Now it is time to run the program. You can Execute the project from the Build pull-down menu by clicking on Run option[Ctrl+F10].

The screenshot shows the Code::Blocks IDE interface with the Build menu open. The 'Run' option is highlighted. The main editor window shows the code for main.c:

```

dio.h>
dlib.h>

Hello world!\n");
;
```

The status bar at the bottom shows the path /h/Gel/putta/workspace/MyProgram/main.c, Unix (LF), UTF-8, Line 6, Column 30, Insert, Read/Write, default.

An output window pops displaying the output of the program. A greeting message "Hello world!" is printed on to the output console.

The screenshot shows a terminal window titled 'MyProject'. The output is:

```

Hello world!
Process returned 0 (0x0) execution time : 0.002 s
Press ENTER to continue.

```

## Installing Code::Blocks IDE

If you want to install Code::Blocks IDE on your system, you can download it from its official webpage.

<http://www.codeblocks.org/>

It is available for Linux, Mac, Windows platforms.

On Debian/Ubuntu systems Code::Blocks can be installed by using the **apt** package manner. You have to be connected to the internet for necessary files to be downloaded. Run the following command.

**\$sudo apt install codeblocks**

For Windows download the binary whose name is like **codeblocks-17.12mingw-setup.exe**

# Chapter 1

## Sorting

### Question

**Write a C++ program to sort the elements in ascending and descending order.**

### C++ Code

```
1 //*****
2 *File      : 01SortElem.cpp
3 *Description : Program to sort the elements in ascending and descending order.
4 *Author     : Prabodh C P
5 *Compiler   : gcc compiler, Ubuntu 22.04
6 *Date       : 26 December 2022
7 *****/
8
9 #include <iostream>
10 #include <iomanip>
11 #include <vector>
12 using namespace std;
13
14 //*****
15 *Function    : main
16 *Input parameters : no parameters
17 *RETURNS    : 0 on success
18 *****/
19 int main() {
20     vector<int> values;
21     int iNum, iElem;
22
23     cout << "Enter the number of elements : ";
24     cin >> iNum;
25
26     cout << "Enter " << iNum << " values :";
27     for(int i=0;i<iNum;i++){
28         cin >> iElem;
29         values.push_back(iElem);
30     }
31
32     for(int i=0;i<iNum;i++){
33         cout << values[i] << " ";
34     }
35     cout << endl;
36
37     // sort(values.begin(), values.end());
38     //sorting in ascending order
39     cout << "Sorting in descending order" << endl;
```

```

41     for(int i=0;i<iNum;i++){
42         for(int j=0;j<iNum;j++){
43             if(values[i] < values[j]){
44                 int temp = values[i];
45                 values[i] = values[j];
46                 values[j] = temp;
47             }
48         }
49     }
50
51     for(int i=0;i<iNum;i++){
52         cout << values[i] << " ";
53     }
54     cout << endl;

# Chapter 5

## Inheritance

### Question

Create a class named **Shape** with a function that prints "This is a shape". Create another class named **Polygon** inheriting the **Shape** class with the same function that prints "Polygon is a shape". Create two other classes named **Rectangle** and **Triangle** having the same function which prints "Rectangle is a polygon" and "Triangle is a polygon" respectively. Again, make another class named **Square** having the same function which prints "Square is a rectangle". Now, try calling the function by the object of each of these classes.

### C++ Code

```
1 //*****
2 *File          : 05ShapeHeirarchy.cpp
3 *Description   : Program to illustrate inheritance.
4 *Author        : Prabodh C P
5 *Compiler      : gcc compiler, Ubuntu 22.04
6 *Date          : 26 December 2022
7 *****/
8
9 #include <iostream>
10 #include <iomanip>
11 using namespace std;
12
13 class Shape{
14     public:
15         void show();
16 };
17 void Shape::show(){
18     cout << "This is a Shape" << endl;
19 }
20
21 class Polygon : public Shape{
22     public:
23         void show();
24 };
25 void Polygon::show(){
26     cout << "Polygon is a Shape" << endl;
27 }
28
29 class Triangle : public Polygon{
30     public:
31         void show();
32 };
33 void Triangle::show(){
34     cout << "Triangle is a Polygon" << endl;
35 }
```

```

36
37 class Rectangle : public Polygon{
38     public:
39         void show();
40     };
41 void Rectangle::show(){
42     cout << "Rectangle is a Polygon" << endl;
43 }
44
45 class Square : public Rectangle{
46     public:
47         void show();
48     };
49 void Square::show(){
50     cout << "Square is a Rectangle" << endl;
51 }
52
53 /*****
54 *Function      :    main
55 *Input parameters :    no parameters
56 *RETURNS       :    0 on success
57 *****/
58
59 int main() {
60     Shape s1;
61     Polygon p1;
62     Rectangle r1;
63     Triangle t1;
64     Square sq1;
65
66     s1.show();
67     p1.show();
68     r1.show();
69     t1.show();
70     sq1.show();
71     return 0;
72 }
```

Listing 5.1: 05ShapeHeirarchy.cpp

## Output

---

```

1putta:~/.../Programs$ g++ -Wall 05ShapeHeirarchy.cpp
2putta:~/.../Programs$ ./a.out
3This is a Shape
4Polygon is a Shape
5Rectangle is a Polygon
6Triangle is a Polygon
7Square is a Rectangle
```

Listing 5.2: OUTPUT

# Chapter 6

## Multilevel Inheritance

### Question

Suppose we have three classes Vehicle, FourWheeler, and Car. The class Vehicle is the base class, the class FourWheeler is derived from it and the class Car is derived from the class FourWheeler. Class Vehicle has a method 'vehicle' that prints 'I am a vehicle', class FourWheeler has a method 'fourWheeler' that prints 'I have four wheels', and class Car has a method 'car' that prints 'I am a car'. So, as this is a multi-level inheritance; we can have access to all the other classes methods from the object of the class Car. We invoke all the methods from a Car object and print the corresponding outputs of the methods. So, if we invoke the methods in this order, car(), fourWheeler(), and vehicle(), then the output will be

I am a car

I have four wheels

I am a vehicle

Write a C++ program to demonstrate multilevel inheritance using this.

### C++ Code

```
1 /*****
2 *File          : 06MultiLevelInheritance.cpp
3 *Description   : Program to illustrate multi level inheritance.
4 *Author         : Prabodh C P
5 *Compiler       : gcc compiler, Ubuntu 22.04
6 *Date          : 12 January 2023
7 *****/
8 #include <iostream>
9 #include <iomanip>
10 using namespace std;
11
12 class Vehicle{
13     public:
14     void vehicle();
15 };
16 void Vehicle::vehicle(){
17     cout << "I am a vehicle" << endl;
18 }
19
20 class FourWheeler : public Vehicle{
21     public:
22     void fourWheeler();
23 };
24 void FourWheeler::fourWheeler(){
25     cout << "I have four wheels" << endl;
26 }
27
28 class Car : public FourWheeler{
29     public:
```

```

30     void car();
31 }
32 void Car::car(){
